Notes:

Guideline values calculated for this document using latest available CCME protocols except where noted.

1. Value adopted from AEP (1994) and/or CCME (1991)
2. Value adopted from CCME (1999, as amended)
3. For more information see Guidelines for Landfill Disposal of Sulphur Waste and Remediation of Sulphur Containing Soils (AENV, 2011)
4. True total barium as measured by fusion-XRF or fusion-ICP. For more information see Soil Remediation Guidelines for Barite: Environmental Health and Human Health (AENV, 2009)
5. Ecological direct contact values from CCME (1999, as amended), other values calculated in this document
6. Ecological direct contact values from CCME (2007), other values calculated in this document
7. Carcinogenic PAH concentrations must meet the Index of Additive Cancer Risk (IACR) <1 guideline. Individual PAH compounds must also meet guidelines for ecological receptors where specified in Table 1 with footnote 8. The IACR is calculated by dividing the soil concentration of each carcinogenic PAH by its Protection of Domestic Use Aquifer guideline value to calculate a hazard index for each PAH and subsequently summing the hazard indexes for the entire PAH mixture, as follows:

Fine Soil:

$$IACR = \frac{[\text{Benz(a)anthracene}]}{6.4} + \frac{[\text{Benzo(b)fluoranthene}]}{3.0} + \frac{[\text{Benzo(k)fluoranthene}]}{0.64} + \frac{[\text{Benzo(g,h,i)perylene}]}{130} + \frac{[\text{Benzo(a)pyrene}]}{7.0} + \frac{[\text{Chrysene}]}{40} + \frac{[\text{Dibenz(a,h)anthracene}]}{4.4} + \frac{[\text{Indeno(1,2,3-c,d)pyrene}]}{51}$$

Coarse Soil:

$$IACR = \frac{[\text{Benz(a)anthracene}]}{12} + \frac{[\text{Benzo(b)fluoranthene}]}{5.8} + \frac{[\text{Benzo(k)fluoranthene}]}{1.2} + \frac{[\text{Benzo(g,h,i)perylene}]}{250} + \frac{[\text{Benzo(a)pyrene}]}{14} + \frac{[\text{Chrysene}]}{78} + \frac{[\text{Dibenz(a,h)anthracene}]}{8.5} + \frac{[\text{Indeno(1,2,3-c,d)pyrene}]}{98}$$

8. For ecological receptors only
9. Expressed as toxic equivalents (TEQs) based on 2,3,7,8-TCDD (See CCME, 1999 and updates)
10. When two or more radionuclides are found, the following relationship should be satisfied:

$$\frac{[\text{Radionucl de}]_1}{\text{Guideline } 1} + \frac{[\text{Radionucl de}]_2}{\text{Guideline } 2} + \dots + \frac{[\text{Radionucl de}]_i}{\text{Guideline } i} \leq 1$$

For more information see Canadian Guidelines for the Management of Naturally Occurring Radioactive Materials (NORM) (Health Canada, 2000)

Table 1. Alberta Tier 1 Soil Remediation Guidelines

11. If trichloroethene is found in soil, its degradation product vinyl chloride must also be measured and compared to guideline values
12. Guideline for protection of aquatic life is below detection limit and has not been included in the Tier 1 derivation. Groundwater monitoring is required for all land uses if the Tier 1 guideline is exceeded.
13. Guideline for protection of irrigation water is below detection limit and has not been included in the Tier 1 derivation. Groundwater monitoring is required for agricultural land use if the Tier 1 guideline is exceeded.
14. Analytical methodology specified in the Soil and Groundwater Remediation Guidelines for Monoethanolamine and Diethanolamine (AENV, 2010), or equivalent, must be used. See AENV (2010) for further details.
15. Toxicity assumptions for protection of aquatic life and livestock watering are based on mono- and dihydric phenols. Toxicity assumptions for other pathways are based on phenol. Because of the likelihood for high background concentrations of phenolic compounds in organic soils and soils with organic residues, analysis of phenol is recommended for soil samples unless an aquatic receptor is at risk.
16. Boron must be measured in a saturated paste extract prepared in accordance with Method 15.2.1 (Carter and Gregorich, 2008).
17. Toxicity assumptions for protection of aquatic life and livestock watering are based on mono- and dihydric phenols. Toxicity assumptions for other pathways are based on phenol. Soil samples may be analysed for phenolic compounds as a screening procedure. If analytical results exceed the guideline value, then background concentrations should be evaluated to determine if the phenolic compounds are naturally occurring. Speciation to determine mono- and dihydric phenols may also be undertaken and the results compared to the Tier 1 guideline.
18. Human health direct soil contact guidelines for carcinogenic PAHs are based on B[a]P Total Potency Equivalents (TPE). TPEs are calculated by multiplying the soil concentration of individual carcinogenic PAHs by a the standardized Benzo[a]pyrene Potency Equivalence Factor (PEF) to produce a Benzo[a]pyrene relative potency concentration, and by subsequently summing the relative potency concentrations for entire PAH mixture. B[a]P PEFs are order of magnitude estimates of carcinogenic potential and are based on the World Health Organization (WHO/IPCS, 1998) scheme, as follows:

Carcinogenic PAH Compound	PEF
Benz[a]anthracene	0.1
Benzo(b+j)fluoranthene	0.1
Benzo[k]fluoranthene	0.1
Benzo[ghi]perylene	0.01
Benzo[a]pyrene	1
Chrysene	0.01
Dibenz[a,h]anthracene	1
Indeno[1,2,3-c,d]pyrene	0.1

19. The B[a]P Total Potency Equivalents (TPEs) calculated for specific soil samples using Potency Equivalency Factors (PEFs) should be multiplied by an Uncertainty Factor of 3 when evaluating PAH mixtures associated with creosote or coal tar-type environmental releases, prior to evaluating against the human health direct contact soil remediation guideline.

Notes:

1. See Environmental Quality Guidelines for Alberta Surface Waters (ESRD, 2014) for further guidance on aquatic life pathway.
2. Tier 1 guideline = lowest of aquatic life guideline and all other guidelines (See Appendix B).
3. B[a]P TPE (Total Potency Equivalents) are calculated by multiplying the groundwater concentration of individual carcinogenic PAHs by a standardized Benzo[a]pyrene Potency Equivalence Factor (PEF) to produce a Benzo[a]pyrene relative potency concentration, and by subsequently summing the relative potency concentrations for the entire PAH mixture. B[a]P PEFs are order of magnitude estimates of carcinogenic potential and are based on the estimates of carcinogenic potential and are based on the World Health Organization (1999) scheme, as follows:

Carcinogenic PAH Compound	PEF
Benz[a]anthracene	0.1
Benzo(b+j)fluoranthene	0.1
Benzo[k]fluoranthene	0.1
Benzo[ghi]perylene	0.01
Benzo[a]pyrene	1
Chrysene	0.01
Dibenz[a,h]anthracene	1
Indeno[1,2,3-c,d]pyrene	0.1

Table 2. Alberta Tier 1 Groundwater Remediation Guidelines

4. For ecological receptors only
5. If trichloroethene is found in groundwater, its degradation product vinyl chloride must also be measured and compared to guideline values
6. Toxicity assumptions for protection of aquatic life and livestock watering are based on mono- and dihydric phenols. Toxicity assumptions for other pathways are based on phenol. Groundwater samples may be analysed for phenolic compounds as a screening procedure. If analytical results exceed the guideline value, then background concentrations should be evaluated to determine if the phenolic compounds are naturally occurring. Speciation to determine mono- and dihydric phenols may also be undertaken and the results compared to the Tier 1 guideline.
7. When two or more radionuclides are found, the following relationship should be satisfied:

$$\frac{[\text{Radionuclide}]_1}{\text{Guideline } 1} + \frac{[\text{Radionuclide}]_2}{\text{Guideline } 2} + \dots + \frac{[\text{Radionuclide}]_i}{\text{Guideline } i} \leq 1$$

8. As S, but can be applied to undissociated H₂S if concerns arise.

NGR = no guideline required - values for all exposure pathways that could be calculated are above compound solubility

Table 3. Alberta Tier 1 Subsoil Remediation Guidelines (BTEX and PHCs Only)

Soil Type	Fine					Coarse					Notes

Notes:

Guideline values calculated for this document using latest available CCME protocols except where noted.

1. Ecological direct contact pathway may be eliminated below 3 metres in depth for F1 to F4 only; the next lowest guideline value applies.

2. Ecological direct contact values from CCME (1999), other values calculated in this document

3. All values calculated in this document

Table 4. Alberta Tier 1 Salt Remediation Guidelines

Rating Categories	Good	Fair	Poor	Unsuitable	Commercial/Industrial
<i>Topsoil^e</i>					
EC ^a (dS/m)	<2 ^c	2 to 4	4 to 8	>8	4
SAR ^b	<4	4 to 8	8 to 12	>12 ^d	12
<i>Subsoil^e</i>					
EC ^a (dS/m)	<3	3 to 5	5 to 10	>10	4
SAR ^b	<4	4 to 8	8 to 12	>12	12

Notes:

- a. Electrical conductivity, measured in a saturated paste extract prepared in accordance with Method 15.2.1 (Carter and Gregoritch, 2008).
- b. Sodium Adsorption Ratio, measured in a saturated paste extract prepared in accordance with Method 15.2.1 (Carter and Gregoritch, 2008).
- c. Some plants are sensitive to salts at EC < 2 dS/m (e.g., flax, clover, beans, some wheat varieties, peas, some garden crops).
- d. Material characterized by SAR of 12 to 20 may be rated as poor if texture is sandy loam or coarser and saturation % is less than 100.
- e. Topsoil: surface A, L, F, H, and O horizons on the control area, or the equivalent surface soil where these horizons are not present.
- Subsoil: B and C horizons and the upper portion of the parent material.
